

War System

A concise reference to the rules currently running in Diplomatia: declarations, distance, strategic rounds, combat strength, losses, supply, and post-war consequences.

The basic shape of a war

A war is a scheduled contest between two nations. Each side commits real military inventory, chooses an operation and posture for the next round, pays the supply cost of the force in the field, and receives a report after resolution. Rounds occur every six hours at 00:00, 06:00, 12:00, and 18:00 UTC. A war lasts no more than 20 rounds, or five days.

Rule	Current value	What it means
War slots	2 offensive / 3 defensive	A nation cannot open a third offensive war or be placed into a fourth defensive war.
Guardian	Blocks declarations	A protected nation cannot be targeted. Declaring war immediately revokes the attacker's own Guardian status.
Initial deployment	Attacker: chosen force; Defender: saved settings	The defender's saved percentage is applied separately to each available unit type. Every setting defaults to 60%. Travel rounds resolve without combat.
Repeat conflict	7-day armistice	The same pair of nations cannot immediately redeclare after a war ends.
Reconstruction	3 / 5 / 7 days	The losing nation cannot open an offensive war during reconstruction. A recovering nation can face only one defensive front.

Automatic defense settings

Each unit type can be set from 0% to 100% in Military Command. A 0% setting leaves that unit entirely manual. Percentages are applied to forces available when a new declaration is made; changing them does not move forces already committed to an active war.

Distance and arrival time

Distance is calculated from the two stored nation locations using the Haversine formula. It affects both how long attacking forces take to arrive and how expensive they are to supply. The defender's home force is present immediately, but it cannot attack an absent force during the attacker's initial transit.

```
a = sin^2(dLat/2) + cos(lat1) * cos(lat2) * sin^2(dLon/2)
distance = 2 * 6371 km * atan2(sqrt(a), sqrt(1-a))
```

```
Mobilization rounds = min(5, 1 + floor(distance / 3500 km))
Attacker supply factor = 1 + min(1.25, distance / 12000 km)
```

Initial transit rounds

If the attacking force has not arrived, the round records mobilization only. Neither side attacks, takes casualties, earns score, loses resolve, or pays combat supply for that round. Combat begins in the calculated arrival round; a one-round mobilization therefore begins combat in round one.

Reinforcements

Defensive reinforcements arrive in the next round. Attacking reinforcements use the same distance-based mobilization delay as the initial force. A deployed unit remains committed to that war until it is lost or the war ends.

How a strategic round is resolved

Every deployed unit contributes a base strength. The chosen operation changes which unit types are most effective, while posture, readiness, organization, supply, war exhaustion, and a small deterministic combat variation scale the final result.

```
Effective strength = sum(units * base strength * operation modifier)
* posture * readiness/100 * organization/100 * supply
* exhaustion factor * combat variation
```

Unit	Base strength	Supply per unit per round
Soldier	1	2 cash + 0.001 Foodstuffs
Tank	34	100 cash + 0.02 Energy + 0.002 Military Equipment
Ship	85	300 cash + 0.08 Energy + 0.004 Military Equipment
Fighter jet	62	250 cash + 0.06 Energy + 0.006 Military Equipment
Drone	18	80 cash + 0.02 Energy + 0.004 Military Equipment

Operations and posture

Choice	Main effect
Ground Assault	Soldiers and tanks x1.25; other units x0.90.
Air Campaign	Jets and drones x1.30; other units x0.92.
Naval Blockade	Ships and jets x1.32; other units x0.82. Ships gain another x1.15 on maritime routes.
Strategic Strike	Jets and drones x1.22; other units x0.88.
Resupply	All units fight at x0.72, but readiness rises by 7 and organization by 9.
Aggressive posture	Strength x1.13, but that side takes 15% more casualties.
Entrenched posture	Strength x1.08 without the aggressive casualty penalty.

Matching the declared objective matters. A Naval Blockade used for a Blockade objective gains x1.18; Ground Assault or Air Campaign used for Military Suppression gains x1.10; and Strategic Strike used for an Infrastructure Campaign gains x1.18. Orders not submitted in time default to Hold Position and Entrenched.

Supply, exhaustion, and losses

The attacker pays the listed supply costs multiplied by the distance factor. If cash or a required resource is short, supply effectiveness falls to the scarcest available ratio, with a floor of 0.35. Supply is therefore never an immunity switch, but an undersupplied force fights well below full strength.

```
Attacker exhaustion factor = 1 - min(0.35, exhaustion / 250)
Defender exhaustion factor = 1 + min(0.25, exhaustion / 400)
```

```
Attacker loss rate = 0.004 + 0.03 * defender strength share
Defender loss rate = 0.004 + 0.03 * attacker strength share
```

Losses are removed from military inventory immediately. Each completed war round adds 2 war exhaustion to both nations; the normal hourly turn reduces exhaustion by 0.1. Combat variation is fixed from the war, round, and side, and ranges from 0.92 to 1.08.

Winning, capitulation, and consequences

Each round awards score according to effective strength share. At the same time, the opposing share reduces national resolve. A war ends immediately when one side reaches zero resolve, or after the round limit when the score is compared.

Score gained = $2 + 7 * \text{own strength share}$
Resolve lost = $1 + 7 * \text{opposing strength share}$

End state	Threshold	Result
Stalemate	Score difference 3 or less	No winner is recorded.
Minor victory	Difference above 3	Loser receives 3 days of reconstruction.
Major victory	Difference 15 or more	Loser receives 5 days of reconstruction.
Decisive victory	Difference 35 or more, or resolve reaches 0	Loser receives 7 days of reconstruction.
Capitulation	After round 4, or at 35 resolve or lower	The opponent receives a major victory.

Economic damage and objective rewards

Every clear defeat now damages the losing nation's Infrastructure. The Infrastructure Campaign objective increases that damage when the attacker wins; other objectives retain their normal strategic effects.

Result	Implemented effect
Any clear defeat	Infrastructure loss is 0.75% / 1.5% / 2.5% after a minor / major / decisive defeat. Stalemates inflict no concluding Infrastructure damage.
Resource Seizure	Transfers 1% / 2% / 3% of each strategic commodity for a minor / major / decisive victory, capped at 250 units of each commodity.
Infrastructure Campaign	With at least one Strategic Strike, total Infrastructure loss becomes 2% / 4% / 6%. Without one, only the campaign bonus is halved, producing 1.375% / 2.75% / 4.25%.

Civic institution damage

Institutions use a separate per-building damage roll: 0.4% / 0.8% / 1.2% after a minor / major / decisive defeat, plus 0.1 percentage point per winning Strategic Strike round (up to 1.2 points) and 0.6 points for a successful Infrastructure Campaign. Risk is capped at 3% per institution. Infrastructure never falls below 50, and falling below institution capacity does not delete or disable existing institutions; only this independent combat-damage roll can destroy one.

No reward for losing

Reconstruction limits fresh offensive declarations and prevents defensive dogpiling beyond one front, but it does not grant Guardian protection or an economic bonus. Every completed war also creates a seven-day armistice between the same two nations.

Military capacity and daily mobilization

Military ownership is capped by population and province count. Domestic production is also paced so that moving from an empty force to the cap normally takes about ten server days.

Unit capacity = $\text{floor}(A * \text{population}) + B * \text{provinces} + C$
Daily production limit = $\text{min}(\text{capacity}, \text{max}(\text{unit floor}, \text{ceil}(0.10 * \text{capacity})))$

Unit	A	B	C	Daily floor
Soldiers	0.10	1,000	5,000	500
Tanks	0.005	50	50	10
Ships	0.0015	20	10	2
Fighter jets	0.002	25	15	3

Unit	A	B	C	Daily floor
Drones	0.006	40	30	5

Current testing switches

National Project production gates are wired but disabled by default. Setting `MILITARY_PROJECT_REQUIREMENTS=true` restores them without a migration. Bot nations are also restored each turn to testing floors of 1,000 soldiers, 25 tanks, 5 ships, and 25 fighter jets; this does not spend resources or use their daily production allowance.
